

Empty-start formation creates correlations while vacancy motion continues

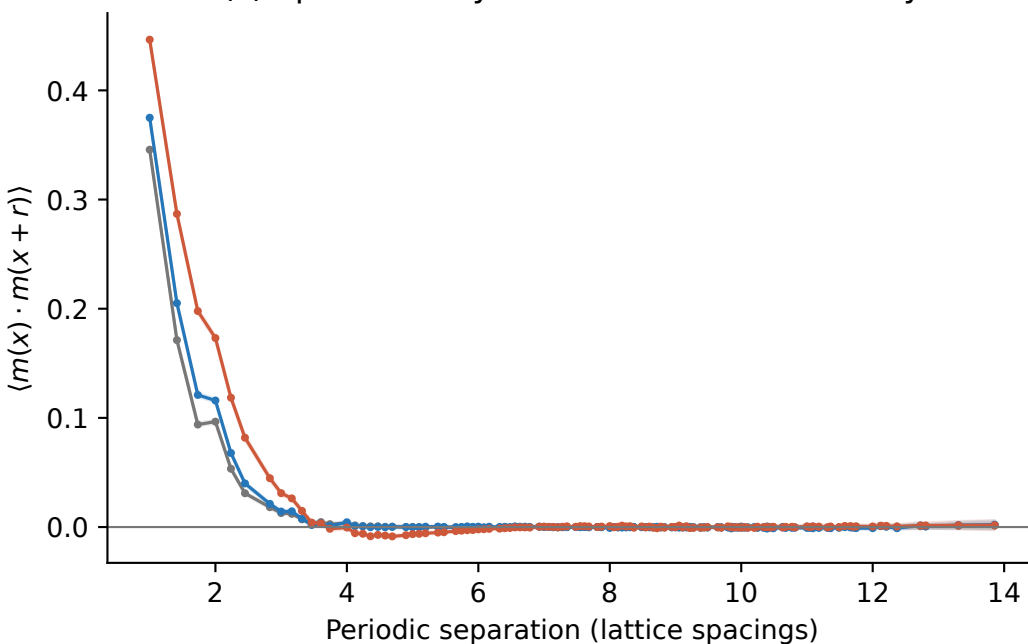

(a) Formation from an empty cube

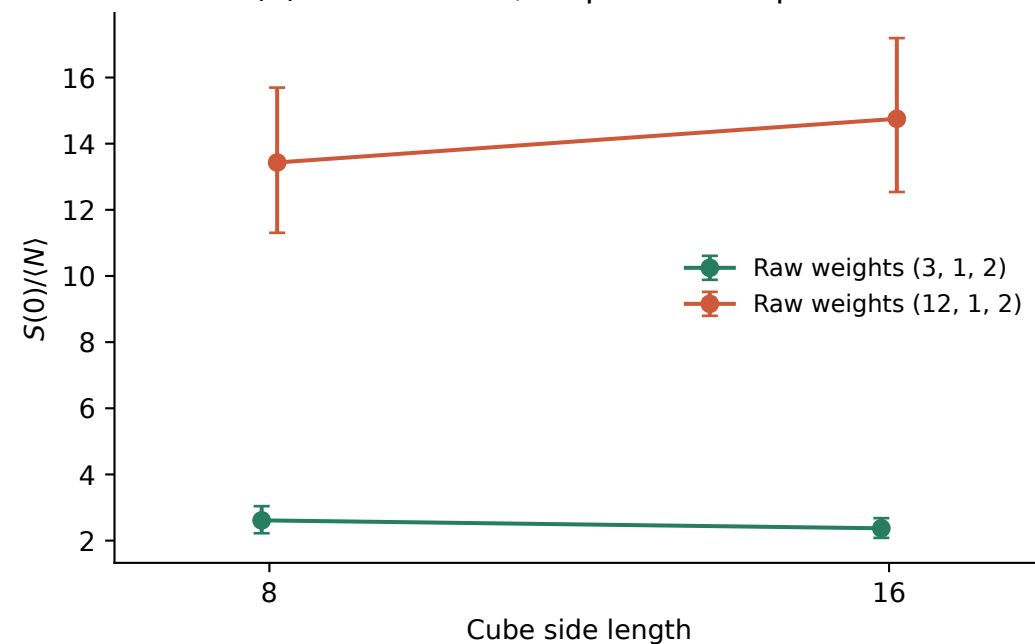

(b) Vector correlations at mean density 0.9

(c) Spatial decay at the same mean density

(d) Two volumes; no phase extrapolation

Finite supplied stochastic model. Panels a-c: side 16, raw weights (12,1,2), normalized to row sum six.
 128 trajectories/case; b-d: pointwise 95% trajectory-bootstrap intervals. Density interpolation error is separate.
 Panel d: motion / formation = 100. Correlations are not an established phase, massless field, or physical force.
