

The winding geometry predicts strong finite-size directional damping

Points ± 1 standard error: simulation • Dashed: projected-generator benchmark • Dotted red: Euler target

• N=16 • N=32 • N=64 • N=128

No fitted parameters. The exact initial generator projection does not close at finite time for $\gamma=1$.
This comparison was specified after the original mode-averaged results; it covers only the fixed winding matching.
